Selected 3 Case Studies

Case No.	Case Name
01	Bakery and Cake Website
02	Online Shopping Website
03	Online Food Ordering Website

This report documents three websites developed using basic HTML and CSS, with simple JavaScript interactions where applicable. Each case study includes an explanation and the actual browser output screenshot.

CASE NO. 01

Bakery and Cake Website

Explanation

The Sweet Bakery website presents cakes, pastries, and cookies in a warm, attractive layout. It allows visitors to view the menu, check prices, read a special offer, and find the bakery's contact information.

Technologies Used: HTML structures the header, menu, product cards, offer, contact section, and footer. CSS creates the pink background, maroon header and footer, white product cards, spacing, and button styles.

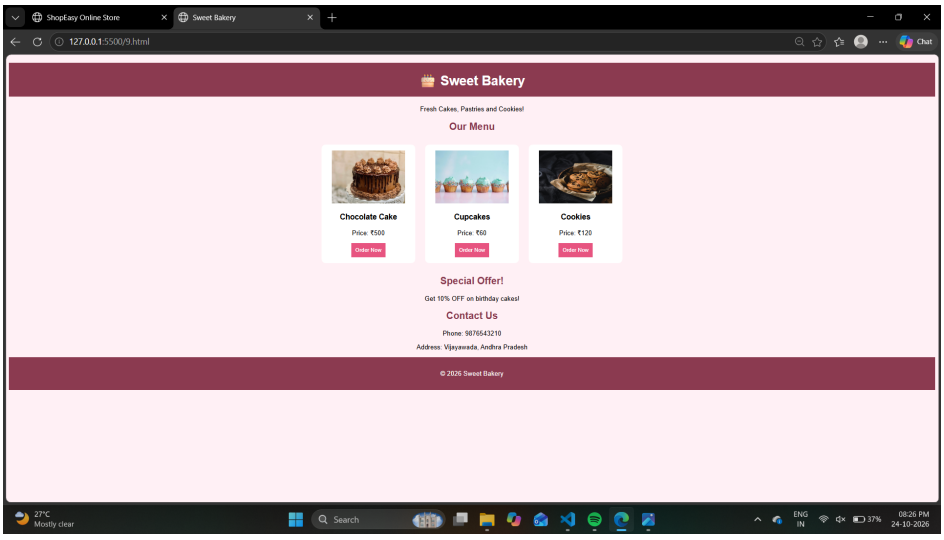

Key Features:
• Product cards for Chocolate Cake (■500), Cupcakes (■60), and Cookies (■120).
• An “Order Now” button on each product card.
• A birthday-cake offer of 10% off.
• Contact phone and Vijayawada address, followed by a footer.

How the Website Works: Visitors can browse the three products and compare their prices. The special offer and contact section provide extra information. The buttons show where an ordering action would begin; a complete online ordering system would need a back-end service to process orders.

Learning Outcome: I learned to create a product menu using HTML, style cards and page sections with CSS, and make business information easy to find.

Output

Actual browser output — Sweet Bakery

CASE NO. 02

Online Shopping Website

Explanation

The ShopEasy website demonstrates an online store where users can browse product categories, view featured items, compare prices and discounts, and find store contact details.

Technologies Used: HTML is used for the store header, navigation, promotional banner, categories, product cards, offers, and contact section. CSS styles the blue header, yellow promotional areas, light background, product cards, and orange buttons. A simple JavaScript alert can demonstrate a button click.

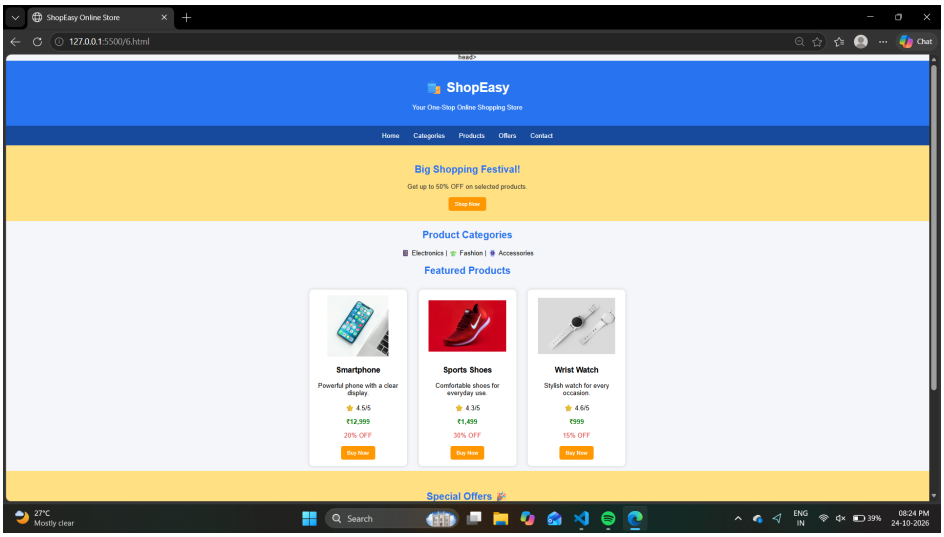

Key Features:
• Categories: Electronics, Fashion, and Accessories.
• Featured products: Smartphone, Sports Shoes, and Wrist Watch.
• Product ratings, prices, and discount labels.
• Shopping-festival banner, special offers, and contact details.

How the Website Works: Visitors use the navigation links and category labels to explore the page. Each product card displays an image, description, rating, price, and discount. The “Buy Now” buttons demonstrate the shopping action. A real store would need a shopping cart, inventory database, secure payment system, and order tracking.

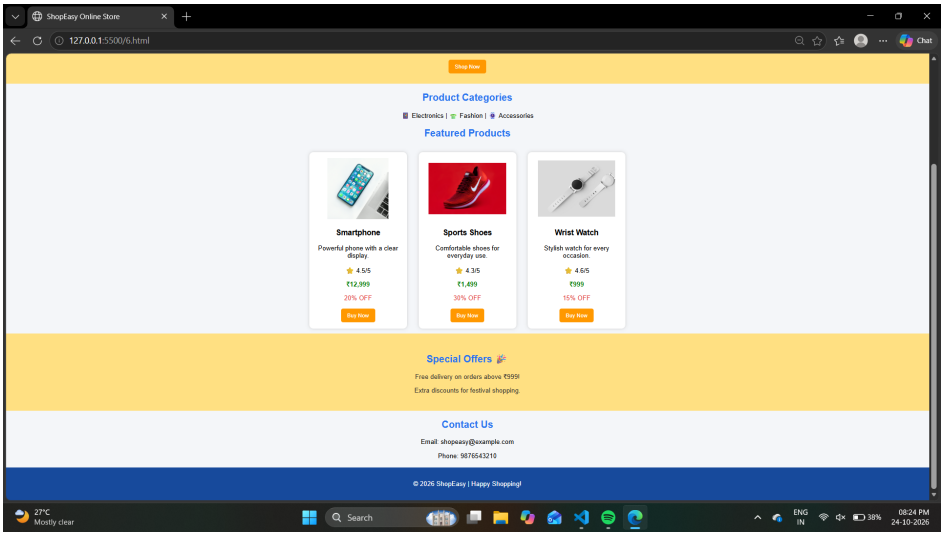

Learning Outcome: I learned to arrange products into cards, display price and discount information clearly, and use contrasting colours to make offers noticeable.

CASE NO. 03

Online Food Ordering Website

Explanation

The Foodie Hub website displays a restaurant menu and helps visitors explore food items, prices, offers, reviews, and contact information in one place.

Technologies Used: HTML builds the restaurant heading, navigation, welcome section, menu cards, offers, reviews, and contact details. CSS uses an orange header, cream background, menu cards, and orange order buttons. Simple JavaScript can show a message when an order button is clicked.

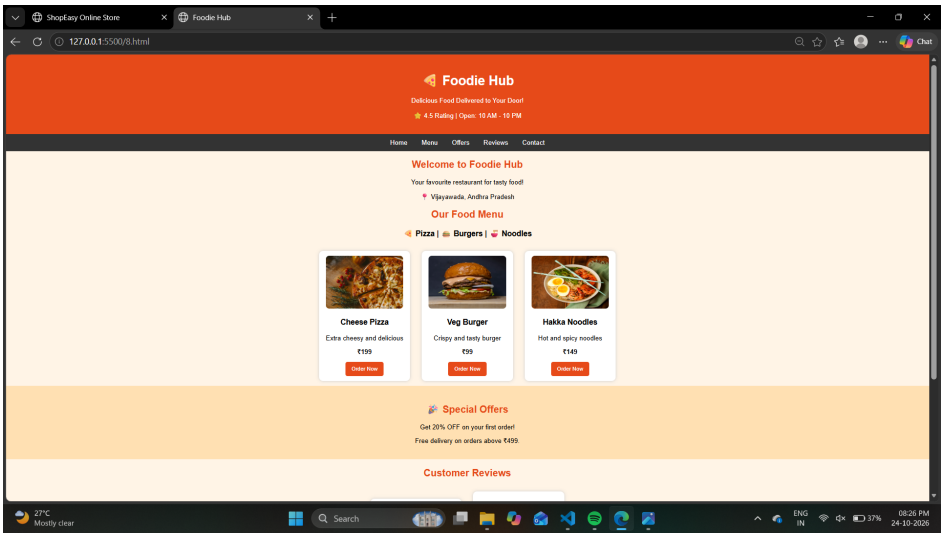

Key Features:
• Menu items: Cheese Pizza (■199), Veg Burger (■99), and Hakka Noodles (■149).
• Food descriptions and “Order Now” buttons.
• 20% off the first order and free delivery above ■499.
• Customer reviews, opening hours, and contact information.

How the Website Works: Visitors read the menu and compare dishes and prices, then review available offers. The order buttons illustrate where a customer would begin placing an order. A production website would need server-side order handling, delivery details, payment processing, and order status updates.

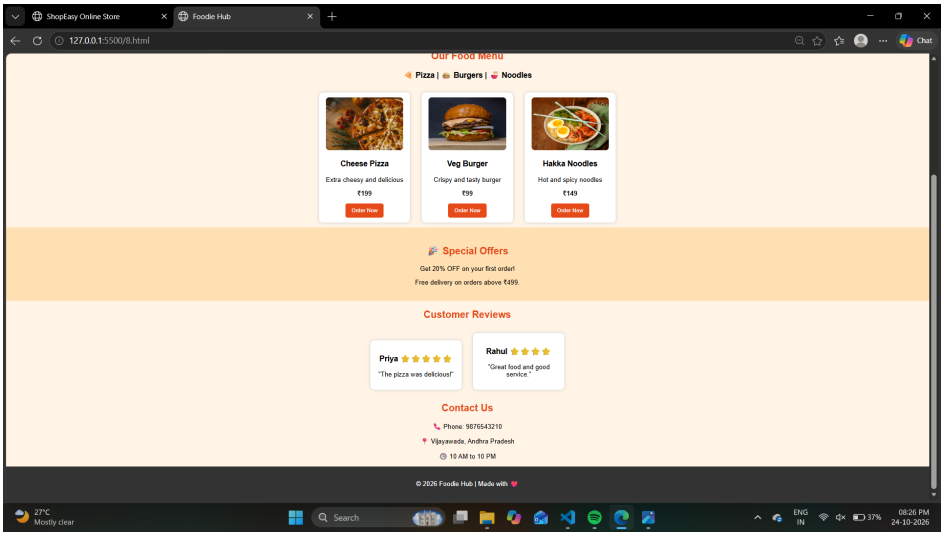

Learning Outcome: I learned to organise a restaurant menu, highlight discounts, show customer reviews, and use a consistent design for a food-related website.

Conclusion

This activity helped me practise the basic process of designing and developing websites with HTML and CSS. The Sweet Bakery website focuses on displaying bakery products, ShopEasy organises shopping categories and product details, and Foodie Hub presents a restaurant menu with offers and reviews. The screenshots show the actual browser outputs of the pages created for these case studies. The work improved my understanding of web page structure, styling, product presentation, and simple user interactions.

Overall Learning Outcomes

• Understand the basic structure of an HTML document.
• Use CSS to style colours, spacing, borders, and layouts.
• Organise information into readable sections and product cards.
• Add simple interactions with JavaScript where required.
• Understand that real shopping and food-ordering services need back-end systems, databases, and secure payment processing.
